May 4th, 2017

Part I: Theory

The following exercises have to be **solved at home**. You will present your answers during the tutorials.

1. Show for each of the following sets (1) whether they are linearly independent, (2) whether they span \mathbb{R}^3 and (3) whether they form a basis of \mathbb{R}^3 :

(a)
$$B_1 = \left\{ \begin{pmatrix} 1\\1\\1 \end{pmatrix}, \begin{pmatrix} 0\\1\\1 \end{pmatrix}, \begin{pmatrix} 0\\0\\1 \end{pmatrix} \right\}$$

(b)
$$B_2 = \left\{ \begin{pmatrix} 2\\1\\0 \end{pmatrix}, \begin{pmatrix} 1\\1\\0 \end{pmatrix} \right\}$$

(c)
$$B_3 = \left\{ \begin{pmatrix} 2\\1\\0 \end{pmatrix}, \begin{pmatrix} 3\\1\\0 \end{pmatrix}, \begin{pmatrix} 0\\0\\1 \end{pmatrix}, \begin{pmatrix} 1\\0\\1 \end{pmatrix} \right\}$$

2. Which of the following sets forms a group (with matrix-multiplication)? Prove or disprove!

(a)
$$G_1 := \left\{ A \in \mathbb{R}^{n \times n} | \det(A) \neq 0 \land A^T = A \right\}$$

(b)
$$G_2 := \{ A \in \mathbb{R}^{n \times n} | \det(A) = -1 \}$$

(c)
$$G_3 := \{ A \in \mathbb{R}^{n \times n} | \det(A) > 0 \}$$

3. Prove or disprove: There exist vectors $\mathbf{v}_1,...,\mathbf{v}_5\in\mathbb{R}^3\setminus\{\mathbf{0}\}$, which are pairwise orthogonal, i.e.

$$\forall i, j = 1, ..., 5: \langle \mathbf{v}_i, \mathbf{v}_j \rangle = 0$$

Part II: Practical Exercises

- 1. Basic image processing
 - (a) Download lena.png
 - (b) Load the image into the workspace.
 - (c) Determine the size of the image and show the image.
 - (d) Convert the image to gray scale and determine the maximum and the minimum value of the image.
 - (e) Apply a gaussian smoothing filter (e.g. using the Matlab-functions conv2, fspecial) and save the output image
 - (f) Show 1) the original image, 2) the gray scale image and 3) the filtered image in one figure and give the figures appropriate titles.
 - (g) Compare the gray scale image and the filtered image for different values of the smoothing.
- 2. Basic operations

(a) Let
$$A=\left(\begin{array}{ccc} 2 & 2 & 0 \\ 0 & 8 & 3 \end{array}\right)$$
 and $b=\left(\begin{array}{ccc} 5 \\ 15 \end{array}\right)$. Solve $Ax=b$ for x .

- (b) Define a matrix B equal to A.
- (c) Change the second element in the first row of A to 4.
- (d) Compute the following:

$$\begin{aligned} c &= 0; \\ \text{for } i &\in \{-4,0,4\} \\ c &= c + i * A^\top * b \\ \text{end} \\ \text{print } c \end{aligned}$$

- (e) Compare A .* B and A' * B and explain the difference.
- 3. Write a function approxequal (x, y, ϵ) checking if two vectors x and y are almost equal, i.e. if

$$\forall i: |x_i - y_i| \le \epsilon$$
.

The output should be logical 1 or 0.

If the input consists of two matrices, your function should compare the columns of the matrices if they are almost equal. In this case, the output should be a vector with logical values 1 or 0.

4. Write a function addprimes(s,e) returning the sum of all prime numbers between s and e. Use the Matlab-function is prime.
